Lab Report

Department of Information and Communication
Technology

Report No: 03

Report Name: TCP and router queues.

Course Title: Wireless and Mobile Communication Lab

Course Code: ICT-4202

Submitted By	Submitted To
Name: S. M Atiqur Rahman ID: IT-16052 Session: 2015-16 4 th Year 2 nd Semester Dept. of Information & Communication Technology, MBSTU.	Nazrul Islam Assistant Professor Dept. of Information & Communication Technology, MBSTU.

Submission Date: 11-09-2020

Objective:

For TCP and router queues, we have to create a simple topology with two client node1, node 2 on the left side and node3 and node4 in the right side. We have to add drop tail queues of size QueueSize5 and QueueSize6 to Node5 and Node5 and Node6. Install a TCP socket instance on Node1 that will connect to Node3.

We have to Install a TCP socket instance on Node2 that will connect to Node3 and also Install a TCP socket instance on Node2 that will connect to Node4. Measure packet loss and cwnd size, and plot graphs throughput/time, cwnd/time and packet loss/time for each of the flows.

Source Code:

```
// Network topology
//
//          192.168.1.0                      192.168.2.0
// n1 ----- n2 ----- n3
// point-to-point (access link)          point-to-point (bottleneck link)
// 100 Mbps, 0.1 ms                      bandwidth [10 Mbps], delay [5 ms]
// qdiscs PfifoFast with capacity        qdiscs queueDiscType in {PfifoFast,
ARED, CoDel, FqCoDel, PIE} [PfifoFast]
// of 1000 packets                      with capacity of queueDiscSize packets
[1000]
// netdevices queues with size of 100 packets netdevices queues with size
of netdevicesQueueSize packets [100]
// without BQL                          bql BQL [false]
// *** fixed configuration ***
//
// Two TCP flows are generated: one from n1 to n3 and the other from n3 to
n1.
// Additionally, n1 pings n3, so that the RTT can be measured.
//
// The output will consist of a number of ping Rtt such as:
//
// /NodeList/0/ApplicationList/2/$ns3::V4Ping/Rtt=111 ms
// /NodeList/0/ApplicationList/2/$ns3::V4Ping/Rtt=111 ms
// /NodeList/0/ApplicationList/2/$ns3::V4Ping/Rtt=110 ms
// /NodeList/0/ApplicationList/2/$ns3::V4Ping/Rtt=111 ms
// /NodeList/0/ApplicationList/2/$ns3::V4Ping/Rtt=111 ms
// /NodeList/0/ApplicationList/2/$ns3::V4Ping/Rtt=112 ms
// /NodeList/0/ApplicationList/2/$ns3::V4Ping/Rtt=111 ms
```

```
//  
// The files output will consist of a trace file with bytes in queue and of a trace  
// file for limits  
// (when BQL is enabled) both for bottleneck NetDevice on n2, two files with  
// upload and download  
// goodput for flows configuration and a file with flow monitor stats.  
//  
// If you use an AQM as queue disc on the bottleneck netdevices, you can  
// observe that the ping Rtt  
// decrease. A further decrease can be observed when you enable BQL.
```

Conclusion:

The specific characteristics of TCP and Router queues include the manner in which they avoid routing loops, the manner in which they select preferred routes, using information. This has the added benefit of preventing issues with TCP and router queues loops. TCP and router is related to connecting the network packages simultaneously.
